

Statistical bulletin

Retail sales in Great Britain: June 2016

Changes in the volume and value of sales of goods by retail businesses in Great Britain, providing a timely indicator of economic performance and the strength of consumer spending.

1. Main points

The volume of retail sales in June 2016 is estimated to have increased by 4.3% compared with June 2015.

The underlying pattern in the quantity bought, as suggested by the 3 month on 3 month movement, increased by 1.6%.

Compared with May 2016, the quantity bought in the retail industry is estimated to have decreased by 0.9%.

Average store prices (including petrol stations) fell by 2.5% in June 2016 compared with June 2015.

The amount spent in the retail industry decreased by 0.9% compared with May 2016, and increased by 1.5% compared with June 2015.

The value of online sales increased by 14.1% in June 2016 compared with June 2015, and increased by 0.5% compared with May 2016.

2. Things you need to know about this release

Revisions in this release were primarily caused by re-referencing the indices to 2013 = 100 to align with the National Accounts estimates (only affecting volume data). There were also revisions where late data were incorporated. The earliest revisions point for current price, non-seasonally adjusted data was June 2015. More information on revisions can be found in the background notes.

This bulletin presents estimates of the quantity bought (volume) and amount spent (value) in the retail industry for the period 29 May 2016 to 2 July 2016. Unless otherwise stated, the estimates in this release are seasonally adjusted.

The estimates in this release are based on a monthly survey of 5,000 retailers, including all large retailers employing 100 people or more and those with annual turnover of greater than £60 million who employ 10 to 99 people. It is estimated that this survey covers approximately 95% of all known retail turnover in Great Britain.

The quality of the estimate of retail sales

Retail sales estimates are produced from the Monthly Business Survey – Retail Sales Inquiry (RSI). The timeliness of these retail sales estimates, which are published just 3 weeks after the end of each trading period, makes them an important early economic indicator. The industry as a whole is used as an indicator of how the wider economy is performing and the strength of consumer spending. Current price non-seasonally adjusted data are revised for the previous 13 published periods. More information about the data content for this release can be found in the background notes.

Revisions are an inevitable consequence of the trade-off between timeliness and accuracy. The response rate in June 2016 was 61.8% of questionnaires, accounting for 85.0% of registered turnover in the retail industry. Therefore, the estimate is subject to revisions as more data become available.

All estimates, by definition, are subject to statistical uncertainty. For the retail sales index, we publish the standard error associated with the non-seasonally adjusted estimates of year-on-year and month-on-month growth in the quantity bought as a measure of accuracy. More information on these standard errors can be found in the background notes and in the [quality tables](#) of this release.

We are continually working on methodological changes to improve the accuracy of the retail sales estimates; progress on these can be found on the [continuous improvement page](#).

The [datasets](#) offer different ways to access the data. They include:

- non-seasonally adjusted and seasonally adjusted volume and value indexes by industry
- year-on-year and month-on-month growth rates by industry

3. Main figures

Table 1: Main figures, June 2016

Seasonally adjusted, percentage change

Great Britain

	Most recent month on a year earlier	Most recent 3 months on a year earlier	Most recent month on previous month	Most recent 3 months on previous 3 months
Value (amount spent)	1.5	2.1	-0.9	1.1
Volume (quantity bought)	4.3	4.9	-0.9	1.6
Value (excluding automotive fuel)	1.4	2.1	-1.2	0.9
Volume (excluding automotive fuel)	3.9	4.5	-0.9	1.7

Source: Monthly Business Survey – Retail Sales Inquiry, Office for National Statistics

At a glance

In June 2016:

the quantity bought in the retail industry (volume):

- increased by 4.3% compared with June 2015; this was the 38th consecutive period of year-on-year growth
- decreased by 0.9% compared with May 2016

the amount spent (value):

- increased by 1.5% compared with June 2015
- decreased by 0.9% compared with May 2016

Amount spent in the retail industry

In the 5 week reporting period during June 2016, the amount spent in the retail industry was £36.1 billion (non-seasonally adjusted).

This compares with:

- £29.2 billion in the 4 week reporting period for May 2016
- £35.7 billion in the 5 week reporting period for June 2015

This equates to an average weekly spend of:

- £7.2 billion in June 2016
- £7.3 billion in May 2016 and
- £7.1 billion in June 2015

4. Sector summary

Main points

In June 2016:

- all store types except textile, clothing and footwear stores showed increases in the quantity bought compared with June 2015
- non-seasonally adjusted data show that the prices of goods sold in the retail industry (as measured by the implied price deflator) decreased by 2.5%; this was the 24th consecutive month of year-on-year price falls
- all store types saw falls in average store price compared with June 2015; the largest fall was shown in petrol stations

Table 2: Sector summary, June 2016

Seasonally adjusted

Great Britain

	Percentage change over 12 months			Average weekly sales (£ billion)
	Quantity bought (volume)	Amount spent (value)	Average store price	
Predominantly food stores ¹	3.1	0.3	-2.6	2.9
Predominantly non-food stores ²	3.3	1.1	-1.9	3.0
Non-specialised stores ³	6.6	4.4	-2.0	0.6
Textile, clothing and footwear stores	-6.1	-7.2	-1.2	0.8
Household goods stores	5.0	2.1	-2.6	0.6
Other stores	9.1	6.8	-1.8	0.9
Non-store retailing	12.1	8.3	-1.6	0.6
Fuel stores	7.4	2.3	-5.3	0.7
Total	4.3	1.5	-2.5	7.2

Source: Monthly Business Survey – Retail Sales Inquiry, Office for National Statistics

Notes:

1. Supermarkets, specialist food stores and sales of alcoholic drinks and tobacco.
2. Non-specialised stores, textiles, clothing and footwear, household goods and other stores.
3. Department stores.

More information on how the implied price deflator and other estimates in this release are calculated can be found in section 3 of the background notes.

5. Focus on growth in the retail sector

There has been sustained growth, spanning 31 months in the 3 month on 3 month movement in the quantity bought: the longest period of growth since records began in June 1996. Looking at the quarter months of March, June, September and December, the last time we saw a quarter-on-quarter contraction was Quarter 4 (Oct to Dec) 2012, when the quantity bought decreased by 1.0%.

In Quarter 2 (Apr to June) 2016, there was an increase of 1.6% in the quantity bought compared with Quarter 1 (Jan to Mar) 2016. This is the largest quarter-on-quarter increase since Quarter 4 (Oct to Dec) 2014, when the quantity bought increased by 2.3%.

Figure 1: Quarterly growth for all retailing seasonally adjusted sales volumes, values and implied deflator

Great Britain, Quarter 1 (Jan to Mar) 2010 to Quarter 2 (Apr to June) 2016

Source: Monthly Business Survey – Retail Sales Inquiry, Office for National Statistics

Figure 1 shows that the quantity bought remained relatively constant until late 2013, suggesting consumers bought the same quantity of products each period. However, due to rising average prices, the amount spent in the retail industry increased strongly over the same period.

In 2014, the quantity bought began to increase at a faster pace than the amount spent as average prices began to fall, suggesting consumers bought more goods as prices fell.

Figure 2: Quantity bought (seasonally adjusted) and average store prices (non-seasonally adjusted) in predominantly food stores and predominantly non-food stores

Great Britain, Quarter 1 (Jan to Mar) 2010 to Quarter 2 (Apr to June) 2016

Source: Monthly Business Survey – Retail Sales Inquiry, Office for National Statistics

Figure 2 looks in more detail at quantity bought and average store prices for the 2 main contributors within the retail industry, food and non-food, which contribute approximately 83 pence in every pound spent in the retail industry. Non-store retailing and petrol stations account for the other 17 pence spent in the pound.

Average prices in food stores increased rapidly during the early part of the time series while the quantity bought stayed fairly static. In more recent periods, as prices have fallen the quantity bought has increased, but not to a significant level. This suggests that, consumers do not necessarily buy more, rather they may change to better quality or more expensive products.

The story is slightly different for non-food stores, where we have seen the quantity bought and price fairly static in the early part of the time series; however, as prices started to fall in late 2013 the quantity bought increased significantly. This might suggest that as prices fell consumers bought more in these stores, particularly with the savings made by falling prices in other store types such as food stores and petrol stations.

6. Internet sales in detail

Seasonally adjusted internet sales data are published in the Retail Sales Inquiry (RSI) internet tables and include:

- a seasonally adjusted value index
- year-on-year and month-on-month growth rates

Internet sales are estimates of how much was spent online through retailers across all store types in Great Britain. The reference year is 2013=100.

Main points:

- average weekly spending online in June 2016 was £944.3 million; this was an increase of 14.1% compared with June 2015
- the amount spent online accounted for 14.2% of all retail spending, excluding automotive fuel, compared with 12.6% in June 2015

Table 3 shows the year-on-year growth rates for total internet sales by sector and the proportion of sales made online in each retail sector.

Table 3: Summary of internet statistics, June 2016

Value seasonally adjusted, percentage rates

Great Britain

Category	Year-on-year growth	Sales as a proportion of all retailing	Index categories and their percentage weights
All retailing	14.1	14.2	100
All food	13.0	4.7	15.0
All non-food	12.1	10.7	36.1
Department stores	19.7	12.8	8.6
Textile, clothing and footwear stores	-2.2	13.8	13.9
Household goods stores	41.1	9.4	5.4
Other stores	12.3	7.3	8.3
Non-store retailing	15.9	78.7	49.0

Source: Monthly Business Survey – Retail Sales Inquiry, Office for National Statistics

7. Contributions to growth

The retail industry is divided into 4 retail sectors:

- predominantly food stores (for example, supermarkets, specialist food stores and sales of alcoholic drinks and tobacco)
- predominantly non-food stores (for example, non-specialised stores such as department stores, textiles, clothing and footwear, household goods and other stores)
- non-store retailing (for example, mail order, catalogues and market stalls)
- stores selling automotive fuel (petrol stations)

Figure 3 shows that for every pound spent in the retail industry:

- 40 pence was spent in food stores
- 43 pence in non-food stores

- 8 pence in non-store retailing
- 9 pence in stores selling automotive fuel

Figure 3: Contribution from the 4 main sectors for every pound spent in the retail industry

Great Britain, June 2016

Source: Monthly Business Survey – Retail Sales Inquiry, Office for National Statistics

Notes:

1. Unit - pence

Using these as weights, along with the year-on-year growth rates, we can calculate how each sector contributed to the total year-on-year growth in the quantity bought.

Figure 4: Contributions to year-on-year volume and value growth from the 4 main retail sectors (June 2016 compared with June 2015)

Great Britain

Source: Monthly Business Survey – Retail Sales Inquiry, Office for National Statistics

In June 2016 compared with June 2015, all 4 main retail sectors saw an increase in the quantity bought (volume) and amount spent (value). The largest contribution in the quantity bought came from non-food stores, while the largest contribution in amount spent came from non-store retailing.

Figure 5: Contributions to month-on-month volume and value growth from the 4 main retail sectors (June 2016 compared with May 2016)

Great Britain

Source: Monthly Business Survey – Retail Sales Inquiry, Office for National Statistics

In June 2016 compared with May 2016, 2 of the 4 main retail sectors (food stores and non-food stores) saw a decrease in the quantity bought (volume), while 3 of the 4 main sectors (non-store retailing, non-food stores and food stores) saw a decrease in the amount spent. The largest downwards contribution for both quantity bought and amount spent came from food stores.

8. Distribution analysis

Table 4 shows how sales varied among different-sized retailers. It shows the distribution of reported change in sales values of businesses (from the RSI sample), ranked by size of business (based on number of employees).

Businesses with 40 to 99 employees saw the largest growth in the amount spent in June 2016 compared with June 2015 (14.1%). Businesses with 100 or more employees showed an increase of 0.3%.

Table 4: Distribution Analysis: Change in reported retail sales values between June 2015 and June 2016

Standard reporting periods, by size of business

Great Britain

Number of employees	Weights (%)	Growth since June 2015 (%)
100 and over	78.0	0.3
40 to 99	3.0	14.1
10 to 39	7.1	-9.9
0 to 9	11.9	1.2

Source: Monthly Business Survey – Retail Sales Inquiry, Office for National Statistics

Notes:

1. The table contains information only from businesses that reported in June 2015 and June 2016; it shows reported actual changes in their sales.

More information on the performance of the retail industry by store type and size can be found in the [Business Analysis](#) dataset.

9. Economic context

Figure 6 compares a rolling 3 month period with the same period in the previous year and highlights that the volume of retail sales started to grow strongly from mid-2013. The latest data show an increase in retail sales growth from 4.5% in the 3 months to May 2016 to 4.9% in the 3 months to June 2016. The rolling 3 month on 3 month a year ago growth in retail sales has averaged 4.2% since the start of 2016, which is lower than the 2015 average of 4.5%.

Figure 6: 3 month on 3 month a year earlier growth in the volume of retail sales, June 2007 to June 2016

Great Britain

From Figure 6, 3 distinct periods emerge. Between June 2007 and July 2008, retail sales volumes were experiencing continuous growth, although to a different degree. Growth in inflation, known as [Consumer Prices Inflation \(CPI\)](#), was lower than [average weekly earnings](#) over most of this period; which resulted in rising real earnings, an indicator of the purchasing power of consumers. Moreover, between June 2007 and July 2008, [consumer credit](#) increased by 8.8%, which may have been a factor driving retail sales growth.

However, between August 2008 and May 2013, the volume of retail sales fluctuated between periods of contraction and expansion, which may be partly explained by the economic climate over this period, and coincided with a reduction in consumer credit of 24.8%. Moreover, growth in average weekly earnings was lower than inflation over most of the period, which implies that earnings fell in real terms.

The third period shown in Figure 6 started in June 2013, when growth in volume terms began to increase notably, despite average weekly earnings growing at a slower rate than CPI until September 2014. Moreover, since June 2013, consumer credit has followed a broadly upward trend, growing by 17.7% between June 2013 and May 2016. Between June 2013 and June 2016, the price level (shown by the implied deflator) fell by 5.4%, coinciding with 12.4% growth in the volume of retail sales over this period. In addition, this upturn in spending has been accompanied by a decline in the savings ratio, from an average of 8.6% over the period 2008 to 2012, to an average of 6.5% over the period 2013 to Quarter 1 (Jan to Mar) 2016.

Figure 7 compares a rolling 3 month period with the same period in the previous year for clothing sales. Since 2007, growth in clothing sales has averaged around 2.9%. However, since the beginning of the year, growth in clothing sales has been falling. This slowdown in clothing sales is also reported by the Bank of England in its [Agent Summary of Business Conditions](#) report, which also cited weak growth for footwear. According to the [British Retail Consortium](#), there was a decline in sales in the fashion categories, especially in women’s fashion and footwear, following one of the wettest starts to a UK summer since records began.

Figure 7: 3 month on a year earlier growth in the volume of clothing sales, June 2007 to June 2016

In general, external indicators support the trend in retail sales over the last few months. According to the Confederation of British Industry’s June 2016 [Distributive Trades Survey](#), retail sales volumes held broadly steady in the year to June with sales reported to be above average for the time of year.

According to the [British Retail Consortium](#), Britain's retailers saw stable sales despite the fall in sterling following the EU referendum vote. Similarly, the Bank of England's [Agent Summary of Business Conditions](#) suggests the growth in the value of retail sales had changed little over the second quarter of 2016.

10. International data

The only international estimate of retail sales available for June 2016 was published by the US Census Bureau on 15 July 2016. In its advanced [retail sales estimates for June 2016](#), the amount spent in the US retail industry, including motor vehicles and parts and food services, increased by 0.6% compared with the previous month and increased by 2.7% compared with June 2015. Total sales for the 3 months to June 2016 were up 2.6% from the same period a year ago.

The [latest estimates of the volume of retail trade across the European Union](#), published by Eurostat on 5 July 2016 for May 2016, show the seasonally adjusted volume of retail trade increased by 0.4% in both the euro area (EA19) and EU28 when compared with April 2016. Compared with May 2015, the retail sales index increased by 1.6% in the EA19 and by 2.8% in the EU28. Note that an accurate comparison cannot be made as Eurostat data are calculated on a 2010 = 100 basis, while data for Great Britain are calculated on a 2013 = 100 basis.

11. Background notes

1. What's new

Estimates in this release have incorporated the re-basing and re-referencing of the indices to 2013 = 100 to align with the National Accounts outputs.

2. Understanding the data

i. [Quick Guide to the Retail Sales Index](#)

ii. Interpreting the data

The Retail Sales Index (RSI) is derived from a monthly survey of 5,000 businesses in Great Britain. The sample represents the whole retail sector and includes the 900 largest retailers and a representative panel of smaller businesses. Collectively, all of these businesses cover approximately 90% of the retail industry in terms of turnover.

The RSI covers sales only from businesses classified as retailers according to the [Standard Industrial Classification 2007 \(SIC 2007\)](#), consistent with the international [NACE Rev 2](#) classification of industries. The retail industry is division 47 of the SIC 2007 and retailing is defined as the sale of goods to the general public for household consumption. Consequently, the RSI includes all internet businesses whose primary function is retailing and also covers internet sales by other British retailers, such as online sales by supermarkets, department stores and catalogue companies. The RSI does not cover household spending on services bought from the retail industry as it is designed to only cover goods. Respondents are asked to separate out the non-goods elements of their sales, for example, income from cafes. Consequently, online sales of services by retailers, such as car insurance, are also excluded.

The monthly survey collects 2 figures from each sampled business: the total turnover for retail sales for the standard trading period, and a separate figure for internet sales. The total turnover will include internet sales. The separation of the internet sales figure allows an estimate relating to internet sales to be calculated.

iii. Definitions and explanations

The "value" or current price series records the growth of the value of sales "through the till" before any adjustment for the effects of price changes.

The "volume" or constant price series are created by removing the effect of price changes from the value series. The Consumer Prices Index (CPI) is the main source of the information required on price changes. In brief, a deflator for each type of store (5-digit SIC) is derived by weighting together the CPI components

for the appropriate commodities, the weights being based on the pattern of sales in the base year. These deflators are then applied to the value data to produce volume series.

The “implied deflator” or “the estimated price of goods” is derived by dividing the non-seasonally adjusted value and volume data to leave a price relative. In general, this implied price deflator should be quite close to the retail component of the CPI. More information on the implied price deflator can be found in the [Quick Guide to Retail Sales](#).

iv. Use of the data

The value and volume measures of retail sales estimates are widely used in private and public sector organisations, both domestically and internationally. For example, private sector institutions such as investment banks, the retail industry itself and retail groups use the data to inform decisions on the current economic performance of the retail industry. These organisations are most interested in a long-term view of the retail sector, taken from the year-on-year growth rates. Public sector institutions use the data to help inform decision and policy making. They tend to be most interested in a snapshot view of the retail industry, which is taken from the month-on-month growth rates.

In a recent survey, users found the Retail Sales Index statistics important to their work. It was found crucial for financial modelling of sectors and recognised as a timely indicator for the economy. It has been used as a comparative tool with BRC and other market sources to boost context. Practically, it has been utilised as a comparative tool for business performance and the ability to access internet retail sales has been particularly beneficial to some. On a non-industry level, the RSI was perceived as important for informing political opinions or simply for curiosity by individuals who were not necessarily utilising it as a reference for work purposes.

The Retail Sales Index feeds into estimates of GDP in 2 ways. Firstly, it feeds into the services industries when GDP is measured from the output approach. Secondly, it is a data source used to measure household final consumption expenditure, which feeds into GDP estimates when measured from the expenditure approach.

The data feed into the [first \(or preliminary\) estimate of GDP](#), the [second estimate of GDP](#) and the third estimate, published in the [Quarterly National Accounts](#).

3. Methods

Information on [retail sales methodology](#) is available on our website.

i. Composition of the data

Retail sales estimates are based on financial data collected through the monthly Retail Sales Inquiry. Response rates at the time of publication are included for the current month, and the 3 months prior. The response rates for those historical periods are updated to reflect the current level of response, incorporating data from late returns. There are 2 response rates included with a percentage for the amount of turnover returned, and another percentage for the amount of questionnaire forms. Historical response rates are available in the [quality information dataset](#).

Table 5: Overall response rates (%)

March to June 2016

Great Britain

Year	Period	Turnover	Questionnaire
2016	June	85.0	61.8
	May	95.9	75.3
	April	97.0	76.6
	March	91.7	76.1

Source: Monthly Business Survey – Retail Sales Inquiry, Office for National Statistics

ii. Seasonal adjustment

Seasonally adjusted estimates are derived by estimating and removing calendar effects (for example, Easter moving between March and May) and seasonal effects (for example, increased spending in January as a result of Christmas) from the non-seasonally adjusted (NSA) estimates. Seasonal adjustment is performed each month and reviewed each year, using the standard, widely-used software, X-13-ARIMA-SEATS. Before adjusting for seasonality, prior adjustments are made for calendar effects (where statistically significant), such as returns that do not comply with the standard trading period (there is more information in the Methods: calendar effects section), bank holidays, Easter and the day of the week on which Christmas falls.

The data collected from the retail sales survey estimate the amount of money taken through the tills of retailers; these are non-seasonally adjusted data. These data consist of 3 components:

- “trend” which describes long-term or underlying movements within the data
- “seasonal” which describes regular variation around the trend, that is, peaks and troughs within the time series (the most obvious is the peak in January and the fall in February)
- “irregular” or “noise”, for example, deeper falls within the non-seasonally adjusted series due to bad weather impacting on retail sales

To ease interpretation of the underlying movements in the data, the seasonal adjustment process estimates and removes the seasonal component. It leaves a seasonally adjusted time series made up of the trend and irregular components.

In the non-seasonally adjusted RSI we see large rises in January each year and a fall in the following February, but these are not evident in the seasonally adjusted index. This peak in January is larger than the subsequent fall, but the trend and irregular components in both months are likely to be similar. This means that the movements in the unadjusted series are almost completely a result of the seasonal pattern.

4. Quality

i. Basic quality information

The standard reporting periods can change over time due to the movement of the calendar. Every 5 or 6 years, the standard reporting periods are brought back into line by adding an extra week. For example, January is typically a 4 week standard period but January 1986, 1991, 1996, 2002, 2008 and 2014 were all 5 week standard periods. The non-seasonally adjusted estimates will still contain calendar effects. If the non-seasonally adjusted estimates are used for analysis, this can lead to a distortion depending on the timing of the standard reporting period in relation to the calendar, previous reporting periods and how trading activity changes over time.

The non-seasonally adjusted series contain elements relating to the impact of the standard reporting period, moving seasonality and trading day activity. When making comparisons, you should focus on the seasonally adjusted estimates as these have the systematic calendar-related component removed. Due to the volatility of the monthly data, growth rates should be calculated using an average of the latest 3 months of the seasonally adjusted estimates.

When interpreting the data, the relative weighted contributions of the sectors in the “all retailing” series should be considered. Based on SIC 2007 data, total retail sales consists of: predominantly food stores 40.4%, predominantly non-food stores 42.6%, non-store retailing 7.6% and automotive fuel 9.4%.

ii. Standard error

Standard errors determine the spread of possible movements and are a means of assessing the accuracy of the non-seasonally adjusted month-on-month and year-on-year estimates of all retail sales volumes. The lower the standard error, the more confident we can be that the estimate is close to the true value for the retail population.

The standard error of year-on-year movement for “all retailing” is 0.8%. This represents a drop from 0.9% in June 2015. Between this and the current period, the year-on-year movements mostly remained at 0.9% with the only other fluctuations occurring in May 2016, October 2015 and November 2015, where there was also a standard error of 0.8%.

Table 6 shows the year-on-year movement for the non-seasonally adjusted chained volume measure alongside the standard error across the published sector breakdowns for June 2015 and June 2016. The differences between June 2015 and June 2016 highlight that the standard error has only increased for “household goods stores” while it has decreased or remained stable for other sector breakdowns. The greatest decreases are seen for “automotive fuel”, “non-store retailing” and “other stores”.

More information on standard errors can be found in the [Retail Sales quality tables](#) datasets, which are part of this release.

Table 6: Year-on-year estimates and standard errors, June 2015 and June 2016

Chained volume measure, non-seasonally adjusted

Great Britain

Sector	June 2015		June 2016	
	12-month movement June 2015 (percentage change)	Standard error of 12-month movement, median (percentage points)	12-month movement June 2016 (percentage change)	Standard error of 12-month movement, median (percentage points)
All retailing	3.9	0.9	3.7	0.8
Predominantly food stores	1.9	0.6	3.0	0.6
Predominantly non-food stores	4.4	1.0	2.5	0.9
Non-specialised stores	7.0	1.7	6.3	1.6
Textile, clothing and footwear stores	6.2	1.2	-6.1	1.2
Household goods stores	7.6	1.8	4.7	2.0
Other stores	-0.6	2.4	7.4	2.1
Non-store retailing	14.7	5.3	10.2	5.0
Automotive fuel	2.4	4.0	6.3	3.0

Source: Office for National Statistics

iii. Quality and methodology information

The [RSI Quality and Methodology Information report](#) details the intended uses of the statistics in this bulletin, their general quality and the methods used to produce them.

iv. Revisions triangles

Revisions to data provide one indication of the reliability of main indicators. Table 7 shows summary information on the size and direction of the revisions made to the volume data covering a 5 year period. Note that changes in definition and classification mean that the revisions analysis is not conceptually the same over time.

Table 7: Revision triangles summary, June 2016

Volume seasonally adjusted

Great Britain

	Growth in latest period (%)	Revisions between first publication and estimates 12 months later (percentage points)	
		Average over the last 5 years (mean revision)	Average over the last 5 years without regard to sign (average absolute revision)
Latest 3 months compared with previous 3 months	1.6	-0.16	0.27
Latest month compared with previous month	-0.9	-0.09	0.33

Estimates in this table have been produced by combining a breakdown of commodity sales from 31 large retailers with total sales from other retailers.

The monthly periods consist of 4 weeks except for March, June, September and December which are 5 weeks. January 2014 is also a 5 week period.

The quarterly indices are the weighted averages of the monthly indices for the months within the quarter, the weights being the number of weeks in each monthly period.

¹ The Food, drink and tobacco category, Household goods category and Other non-food category include revisions to the commodity classifications provided by respondents.

Historical data have been revised due to classification changes introduced from the January 2010 release due to the removal of repair from the classification.

5 VALUE OF RETAIL SALES BY COMMODITY AT CURRENT PRICES NON-SEASONALLY ADJUSTED
