Release date:
15 September 2020

Next release:
13 October 2020

Notice

15 September 2020

The effect of the coronavirus (COVID-19) pandemic on our capacity means we have reviewed the existing labour market releases and will be suspending some publications.

This will protect the delivery and quality of our remaining labour market outputs as well as ensuring we can respond to new demands as a direct result of the coronavirus. More details about the impact on labour market outputs can be found in our [statement](#).

2 . Main points

- After a record low estimated number of vacancies in April to June 2020, vacancies have continued to increase and are almost 30% higher in June to August 2020 at 434,000.
- "Construction" and "transport and storage" sectors are showing signs of recovery, with estimated quarterly increases in vacancies of 4,000 and 3,000 respectively.
- "Arts, entertainment and recreation" is the sector that has struggled the most during the coronavirus (COVID-19) pandemic and has the lowest vacancies per 100 employee jobs ratio of 0.5.
- The estimated number of jobs had been generally increasing since 2013, but fell by 354,000 to 35.41 million jobs in the UK from March to June 2020; this was the largest fall since September 1992.
- The estimated number of jobs in "wholesale and retail trade; repair of motor vehicles and motorcycles", the largest sector, increased by 51,000 from March to June 2020; the increase is being driven by supermarkets and retailers adapting to the coronavirus pandemic by launching more online and home delivery services.
- "Administrative and support service activities" saw the largest fall in the estimated number of jobs between March and June 2020; the sector decreased by 150,000, this was driven by employment agencies because of a lack of customer demand.

Because of social distancing measures leading to the temporary closure of businesses across the UK, there have been some difficulties in collecting data and producing estimates. More information can be found in [Measuring the data](#).

3 . Vacancies for June to August 2020

The monthly Vacancy Survey asks businesses for the number of external vacancies on a specified count date, used for three-month rolling averages. Count dates for the latest data, June to August 2020, are 5 June, 3 July and 7 August 2020, all of which follow the start of coronavirus (COVID-19) social distancing measures. Count dates for the previous quarter, March to May 2020, were 6 March, 3 April and 7 May 2020; the responses for the first date are prior to the start of coronavirus social distancing measures.

For the three-month rolling average of vacancies, the standard errors are around 10,000 (1.5% expressed as a [coefficient of variation](#), giving a 95% [confidence interval](#) of plus or minus 20,000.

Figure 1: June to August 2020 saw a continued recovery in the level of vacancies with vacancies almost 30 % higher than the record low in April to June 2020

Number of vacancies in the UK, seasonally adjusted, between June to August 2001 and June to August 2020

Figure 1: June to August 2020 saw a continued recovery in the level of vacancies with vacancies almost 30 % higher than the record low in April to June 2020

Number of vacancies in the UK, seasonally adjusted, between June to August 2001 and June to August 2020

Source: Office for National Statistics – Vacancy Survey

The estimated [number of vacancies](#) in the UK fell sharply during the recession of 2008 to 2009. Since 2013, it has generally increased, reaching a record high of 855,000 in November 2018 to January 2019. Vacancies remained at a high level until the start of coronavirus social distancing measures, where they fell more sharply than during the recession.

For June to August 2020, there were an estimated 434,000 vacancies in the UK, which is almost 30% higher than the record low in April to June 2020. The increase is driven by small businesses (49 or fewer employees). Estimated vacancies for June to August 2020 are 48,000 fewer than in the previous quarter March to May 2020 (where the responses for the first month are prior to the start of coronavirus social distancing measures) and 383,000 fewer than a year earlier.

The vacancy headline estimate is based on a seasonally adjusted, three-month moving average and has [National Statistics](#) status. Single-month vacancy estimates are available in [dataset X06](#). They should be used with caution as they are experimental, non-seasonally adjusted statistics and should not be considered accurate estimates of vacancies in the reported months, because of the high volatility caused by the survey sample design (see [Strengths and limitations](#)).

Figure 2: The experimental single month series indicates an increase of approximately 55% in the estimated vacancies for August 2020 compared with record low in May 2020

Moving three-month averages of vacancies and single-month vacancies in the UK, both non-seasonally adjusted Experimental Statistics, between June to August 2001 and June to August 2020

Figure 2: The experimental single month series indicates an increase of approximately 55% in the estimated vacancies for August 2020 compared with record low in May 2020

Moving three-month averages of vacancies and single-month vacancies in the UK, both non-seasonally adjusted Experimental Statistics, between June to August 2001 and June to August 2020

Source: Office for National Statistics – X06 dataset

The three-month average non-seasonally adjusted series in Figure 2 is more volatile than the seasonally adjusted series shown in Figure 1.

While the experimental single-month estimates should not be considered accurate estimates of vacancies in the reported months, they do indicate an increase of approximately 55% in the estimated vacancies for August 2020 compared with the record low in May 2020. However, estimated vacancies for August 2020 are still around 40% less than in February 2020.

Figure 3: The experimental single month series indicate that the impact by the coronavirus (COVID-19) pandemic varied by sector

Single-month vacancies in the UK, both non-seasonally adjusted Experimental Statistics, between February and August 2020; index February=100, difference in percentage points compared with February

Figure 3: The experimental single month series indicate that the impact by the coronavirus (COVID-19) pandemic varied by sector

Single-month vacancies in the UK, both non-seasonally adjusted Experimental Statistics, between February and August 2020; index February=100, difference in percentage points compared with February

Source: Office for National Statistics – X06 dataset

Sectors showing the largest increases in vacancies since May 2020 are “accommodation and food service activities”, “human health and social work activities”, “transport and storage” and “retail”. “Transport and storage” and “retail” have seen most of the increase in the latest month, driven by businesses recruiting drivers, and supermarkets launching more online and home delivery services.

The sector that is closest to its vacancy levels in February 2020, prior to the coronavirus pandemic, is “transport and storage”, where vacancies are around 10% less than in February 2020.

“Arts, entertainment and recreation” is the sector that has struggled the most during the pandemic, with vacancies in August 2020 around 75% less than in February 2020. “Mining and quarrying” has also struggled during the pandemic with further decreases from May to August. The decline has been driven by low gas and oil prices impacting businesses.

We now publish a weekly Adzuna [Online job advert estimates](#) dataset as part of the [Coronavirus and the latest indicators for the UK economy](#) release. The online job advert estimates show a decline of around 60% in total vacancies from Early March to early May generally followed by an increase and stabilisation of vacancies in July, with vacancies remaining at around 55% of their 2019 average in August.

Transport, logistics and warehouse online job adverts saw the largest increase in vacancies between the start of July and start of August, which is consistent with our Vacancy Survey. The online job advert estimates for the first week in August compared with the first week in May show a smaller increase in vacancies compared with our Vacancy Survey. The increase in our Vacancy Survey estimates is driven by smaller businesses. Any vacancies that are not advertised online would not be included in the online job advert estimates; if small businesses are advertising vacancies through alternative methods this could explain the difference between our Vacancy Survey and the online job advert estimates. The latest weekly online job adverts publish vacancies with a lag of six days and include regional estimates of vacancies.

Figure 4: “Arts, entertainment and recreation” is the sector that has struggled the most during the coronavirus (COVID-19) pandemic and has the lowest vacancies per 100 employee jobs ratio of 0.5

Job vacancies per 100 employee jobs for selected industries in the UK, seasonally adjusted, between June to August 2001 and June to August 2020

Figure 4: “Arts, entertainment and recreation” is the sector that has struggled the most during the coronavirus (COVID-19) pandemic and has the lowest vacancies per 100 employee jobs ratio of 0.5

Source: Office for National Statistics – Vacancy Survey

- the vacancies per 100 employee jobs ratio has increased to 1.4, after a record low of 1.1 in April to June 2020
- “arts, entertainment and recreation” is the sector that has struggled the most during the coronavirus pandemic and has the lowest vacancies per 100 employee jobs ratio of 0.5
- “construction” and “transport and storage” are showing signs of recovery, with quarterly increases in vacancies of 4,000 and 3,000 respectively
- “human health and social work activities” remains the largest sector in terms of both vacancy level (112,000) and ratio (2.7) and accounts for 25.8% of all vacancies
- all sectors show negative annual movements; the two sectors contributing the most to the 383,000 decrease in all vacancies are “wholesale and retail trade; repair of motor vehicles and motorcycles” (down 78,000) and “accommodation and food service activities” (down 68,000)

4 . Jobs for June 2020

Workforce jobs estimates are a combination of estimates of employee jobs mainly sourced from employer surveys, self-employment jobs from the Labour Force Survey, HM Forces personnel and government-supported trainees.

The majority of the latest employee jobs data were sought on a specified count date, 12 June 2020; the previous March 2020 data were from 13 March 2020 before the start of coronavirus (COVID-19) social distancing measures. Latest self-employment estimates from the Labour Force Survey are based on interviews from the start of May to the end of July 2020. The March 2020 data were based on interviews from the start of February to the end of April 2020, so only around half of these relate to the period prior to the start of social distancing, while interviews in the final week of March and the whole of April relate to the lockdown period.

Figure 5: Between March 2020 and June 2020, the total number of jobs in the UK fell by 354,000, the largest fall since September 1992

Number of jobs in the UK, seasonally adjusted, June 2002 to June 2020

Figure 5: Between March 2020 and June 2020, the total number of jobs in the UK fell by 354,000, the largest fall since September 1992

Number of jobs in the UK, seasonally adjusted, June 2002 to June 2020

Source: Office for National Statistics - Workforce jobs

The number of jobs is not the same as the number of people in employment. This is because a person can have more than one job. Estimates for the number of people in employment are available in [Employment in the UK](#).

It is estimated that:

- the number of jobs had been generally increasing since 2013, but in the latest quarter fell by 354,000 to 35.41 million jobs in the UK in June 2020; this was the largest fall since September 1992
- the 354,000 decline in jobs comprises a fall of 227,000 in employee jobs, a fall of 128,000 in self-employment jobs, a rise of 2,000 in HM Forces personnel and a fall of 1,000 in government-supported trainees
- sectors have not been equally impacted during the coronavirus pandemic; most sectors have seen falls in the number of jobs from March to June 2020, however, some sectors have seen a rise in estimated jobs
- the estimated number of jobs in “wholesale and retail trade; repair of motor vehicles and motorcycles”, the largest sector, increased by 51,000 from March to June 2020; the increase is being driven by supermarkets and retailers adapting to the coronavirus pandemic by launching more online and home delivery services
- “administrative and support service activities” saw the largest fall in the estimated number of jobs between March and June 2020; the sector decreased by 150,000, this was driven by employment agencies because of a lack of customer demand

Figure 6: Sectors have not been equally impacted during the coronavirus (COVID-19) pandemic, most sectors have seen falls in the number of jobs from March to June 2020, however, some sectors have seen a rise in estimated jobs

Changes in the number of jobs in the UK, seasonally adjusted, March 2020 to June 2020

Figure 6: Sectors have not been equally impacted during the coronavirus (COVID-19) pandemic, most sectors have seen falls in the number of jobs from March to June 2020, however, some sectors have seen a rise in estimated jobs

Changes in the number of jobs in the UK, seasonally adjusted, March 2020 to June 2020

Source: Office for National Statistics – Workforce jobs

The sectors showing the largest estimated quarterly increases in jobs are “wholesale and retail trade; repair of motor vehicles and motorcycles” (51,000), “construction” (23,000), “public admin and defence” (18,000) and “human health and social work activities” (16,000).

The rise in estimated jobs in “wholesale and retail trade; repair of motor vehicles and motorcycles” is driven by supermarkets and retailers adapting to the coronavirus pandemic by moving more services online. In these sectors employee jobs are driving the majority of the positive movement in jobs, with positive contribution from self-employment jobs (except “human health and social work activities”, which saw a fall of 2,000 in self-employment jobs).

The sectors showing the largest estimated quarterly falls in jobs are “administrative and support service activities” (150,000), “accommodation and food service activities” (110,000) and “professional, scientific and technical activities” (91,000). In “administrative and support service activities” the fall was driven by employment agencies because of a lack of customer demand. The “accommodation and food service activities” sector has been heavily impacted by the coronavirus pandemic, with some businesses reporting that they have let staff go.

The quarterly movement in “education” is a fall of 5,000, which is not significant, but it should be noted that the overall movement includes a 21,000 fall in employee jobs and an increase of 15,000 in self-employment jobs. Similarly, “real estate activities” has fallen by 5,000 jobs, which is caused by a 12,000 increase in employee jobs and a 16,000 fall in self-employment jobs.

5 . Vacancies and jobs data

[Vacancies by industry](#)

[Workforce jobs by industry](#)

Dataset JOBS02 | Released 15 September 2020

Estimates of jobs by industry (Standard Industrial Classification 2007).

6 . Glossary

Vacancies

[Vacancies](#) are defined as positions for which employers are actively seeking recruits from outside their business or organisation. The estimates are based on the Vacancy Survey; this is a survey of businesses designed to provide estimates of the stock of vacancies across the economy, excluding “agriculture, forestry and fishing” (a small sector for which the collection of estimates would not be practical).

Jobs

A [job](#) is an activity performed for an employer or customer by a worker in exchange for payment, usually in cash, or in kind, or both. The number of jobs is not the same as the number of [people in employment](#). This is because a person can have more than one job. The number of jobs is the sum of employee jobs from employer surveys, self-employment jobs from the Labour Force Survey (LFS), those in HM Forces and government-supported trainees. The number of people in employment is measured by the LFS; these estimates are available in our [Employment in the UK](#) release.

A [more detailed glossary](#) is available.

7 . Measuring the data

Coronavirus

In response to the developing coronavirus (COVID-19) pandemic, we are working to ensure that we continue to publish economic statistics. For more information, please see [COVID-19 and the production of statistics](#).

We have reviewed all publications and data published as part of the labour market release in response to the coronavirus pandemic. This has led to the [postponement of some publications and datasets](#) to ensure that we can continue to publish our main labour market data. This will protect the delivery and quality of our remaining outputs as well as ensuring we can respond to new demands as a direct result of the coronavirus.

For more information on how [labour market data sources, among others, will be affected by the coronavirus pandemic](#), see the statement published on 27 March 2020. A further article published on 6 May 2020, detailed some of the [challenges that we have faced in producing estimates](#) at this time.

Our latest data and analysis on the impact of the coronavirus on the UK economy and population are now available on our dedicated [COVID-19 webpage](#). This will be the hub for all special coronavirus-related publications, drawing on all available data.

Impact on production of vacancy and workforce job estimates

Because of social distancing measures leading to the temporary closure of businesses across the UK, there have been some difficulties in collecting data using the Vacancy Survey and the Short-Term Employment Surveys. Survey response rates were lower than is typical. To protect the quality of our output, we have used alternative sources where possible to inform data. We have used Standard Industrial Classification (SIC) section-level indications from the Business Impact of COVID-19 Survey (BICS), as well as survey contributor-level comments provided to us over the telephone or electronically, as a guide on whether businesses are operational and likely, or not, to be actively recruiting and to confirm employment figures.

Sources

The data in this bulletin come from surveys of businesses. It is not feasible to survey every business in the UK, so these statistics are estimates based on samples, not precise figures.

Vacancies

Estimates of vacancies are obtained from the [Vacancy Survey](#), a survey of employers.

Jobs

Estimates of jobs are compiled from a number of sources, including Short-Term Employment Surveys (STES), the Quarterly Public Sector Employment Survey (QPSES) and the [Labour Force Survey \(LFS\)](#). STES is a group of surveys that collect employment and turnover information from private sector businesses. In December of each year, the jobs estimates are "benchmarked" to the latest estimates from the [Business Register and Employment Survey \(BRES\)](#).

More quality and methodology information on strengths, limitations, appropriate uses, and how the data were created is available in the [Vacancy Survey QMI](#) and [Workforce jobs QMI](#).

Sampling variability

Sampling variability information for jobs is available in Table 1 in this bulletin and in [dataset JOBS07: Workforce jobs sampling variability](#).

The sampling variability of the three-month average vacancies level is around plus or minus 1.5% of that level.

The sampling variability of the three-month average vacancies level, for a typical industrial sector is around plus or minus 6% of that level.

Table 1: Sampling variability for estimates of jobs in the UK, thousands

SIC 2007 Section	United Kingdom	
	Estimate for Jun 2020	Sampling variability of estimate ¹
A Agriculture, forestry & fishing	362	±45
B Mining & quarrying	59	±7
C Manufacturing	2,653	±40
D Electricity, gas, steam & air conditioning supply	149	±9
E Water supply, sewerage, waste & remediation activities	234	±9
F Construction	2,296	±64
G Wholesale & retail trade; repair of motor vehicles and motorcycles	4,978	±57

S Other service activities/Private Households	1,035	±45
/T		
All jobs	35,400	±205

Source: Office for National Statistics – Workforce Jobs

Notes

1. The sampling variability estimates are for 95% confidence intervals and are calculated on data for June 2020 that are not seasonally adjusted.

8 . Strengths and limitations

Accuracy of the statistics: estimating and reporting uncertainty

The figures in this bulletin mainly come from surveys of businesses, which gather information from a [sample](#) rather than from the whole population. The samples are designed to be as accurate as possible given practical limitations such as time and cost constraints. Results from sample surveys are always estimates, not precise figures. This can have an impact on how changes in the estimates should be interpreted, especially for short-term comparisons.

As the number of people available in the sample gets smaller, the variability of the estimates that we can make from that sample size gets larger. Estimates for small groups (for example, vacancies in the construction industry), which are based on small subsets of the Vacancy Survey sample, are less reliable and tend to be more volatile than for larger aggregated groups (for example, total vacancies in the UK).

In general, short-term changes in the growth rates reported in this bulletin are not usually greater than the level that can be explained by sampling variability. Short-term movements in reported rates should be considered alongside longer-term patterns in the series and corresponding movements in other sources to give a fuller picture.

Vacancies

The vacancy headline estimate is based on a seasonally adjusted, three-month moving average and has [National Statistics](#) status. Further information about how single estimates have impacted the three-month estimates is available in the [x06 dataset](#). These [experimental](#) estimates are non-seasonally adjusted and should not be considered accurate estimates of vacancies in the reported months because of the high volatility caused by the survey sample design. They can be used to indicate an approximate change in the level of total vacancies. Approximately 80% of the rotational survey overlaps every three months, therefore a comparison of vacancy estimates for a given month to three months prior can provide a reasonable indication of the change in monthly vacancies.

Jobs

An annual [reconciliation report of job estimates](#) is published every March comparing the latest workforce jobs (WFJ) estimates with the equivalent estimates of jobs from the Labour Force Survey (LFS).

The concept of employment (measured by the LFS as the number of people in work) differs from the concept of jobs, since a person can have more than one job and some jobs may be shared by more than one person. The LFS, which collects information mainly from residents of private households, is the preferred source of statistics on employment. The WFJ series, which is compiled mainly from surveys of businesses, is the preferred source of statistics on jobs by industry, since it provides a more reliable industry breakdown than the LFS.

During the coronavirus pandemic the LFS and WFJ series may have additional difference because a person's perception of their attachment to a job may differ from the business's perception of that job. It is also important to note that LFS is based on interviews throughout the coverage period, whereas WFJ series to relate to a specific date. This difference can be significant in a labour market that is experiencing rapid changes.

Vacancy Survey enquiries: vacancy.survey@ons.gov.uk, 01633 456777

1. Excludes Agriculture, Forestry and Fishing.

2. Unemployment estimates are produced from the Labour Force Survey (LFS) and are always one period behind the ONS Vacancy Survey estimates. This table therefore shows estimates for the same periods as shown in table 1 (which shows LFS estimates).
