1 . Overview of international migration data and subnational population projections

For this release of subnational population projections, analyses in the bulletin use the migration category variant projection in place of the principal projections. A projection that aligns with the principal projection in the 2022-based national population projections is available as part of this release and is called a five-year migration variant. Because of more up-to-date migration data, we advise use of the migration category variant in place of the principal projections that were referred to in the [National population projections: 2022-based](#), as this is a better reflection of short-term population change.

Demographic behaviour used to develop assumptions for projections is inherently uncertain and so projections become increasingly uncertain the further they are carried forward. This is particularly so for smaller geographical areas and detailed age and sex breakdowns.

2 . Main points

- The population of England is projected to increase by 6.4% between mid-2022 and mid-2032 compared with 5.9% for the UK.
- Between mid-2022 and mid-2032 the population is projected to increase across all regions as well as in 302 of the 309 local authorities in England (based on 2021 boundaries).
- Tower Hamlets is projected to be the fastest growing local authority between mid-2022 and mid-2032, with a 20.4% projected population increase (excludes the City of London).
- Gosport, Copeland and Barrow-in-Furness are the only local authorities projected to decline by more than 1% (excludes the Isles of Scilly).
- The proportion of people under 16 years is projected to decrease in all local authorities, except for the City of London.
- The proportion of people of State Pension age is projected to increase in all but 11 local authorities in England.
- Our interactive tool goes into further depth, exploring changes in each local authority.

Subnational population projections are not forecasts and do not attempt to predict potential changes in international migration. There is uncertainty over future directions and levels of international migration.

At the local level, population change is influenced by economic development and housing policies, factors that are not included in these projections.

Demographic assumptions for future fertility, mortality and migration are based on observed demographic trends. Resulting projections will differ to some extent from future releases of population estimates.

Uncertainty in population projections data

Our use of the migration category variant projection in place of the principal projection is in line with our advice to use the corresponding migration category variant for the UK in our [National population projections: 2022-based bulletin](#). We recommend use of this variant, as it better reflects the international migration patterns, as published in our [Long-term international migration, provisional: year ending December 2024 bulletin](#).

Projected population change is the result of assumptions about future births, deaths and migration, sometimes known as components of population change. For each local authority in England, we collect data on components of change to project these trends forward. The 2022-based subnational projections use data from 2018 to 2022. We project these data forward for 25 years and use the national population projections for England to constrain the projections.

The data used for the subnational projections may not necessarily capture the entire local context in which population change occurs. At the local level, population change is influenced by many factors not considered in the projections, such as economic development and housing policies.

3 . Projected change by local authority

Overall local authority trends

All but seven local authorities in England are projected to grow by mid-2032. Table 1 shows the 10 local authorities with the fastest projected population growth by mid-2032.

Table 1: Local authorities in England with the largest projected population growth between mid-2022 and mid-2032

Local Authority	Population in mid-2022	Population in mid-2032	Population change over 10 years	Percentage population change
Tower Hamlets	323,854	389,845	65,991	20.4
South Derbyshire	111,145	132,463	21,318	19.2
Stratford-on-Avon	138,573	162,678	24,105	17.4
North West Leicestershire	107,666	124,628	16,962	15.8
South Norfolk	144,617	166,982	22,365	15.5
Salford	278,867	321,347	42,480	15.2
Tewkesbury	97,032	111,619	14,587	15.0
Vale of White Horse	142,335	163,566	21,231	14.9
Harborough	100,550	115,004	14,454	14.4
Central Bedfordshire	301,820	345,063	43,242	14.3

Notes

1. City of London has been omitted from the table because of its small population size.

The main causes of the projected population increase vary substantially by area. In many local authorities, growth is mainly caused by internal migration. Internal migration of young people would furthermore contribute to the number of projected births. In many urban areas, growth is mainly caused by net international migration. Details on what is contributing to growth in specific local authorities can be found in our interactive tool.

Table 2 shows the six local authorities with a projected population decline by mid-2032, excluding the Isles of Scilly. In the majority of these areas, the projected population decrease is mainly caused by a projected increase in the number of deaths, as a result of ageing populations in these areas.

Table 2: Local authorities in England with a projected population decline between mid-2022 and mid-2032

Local Authority	Population in mid-2022	Population in mid-2032	Population change over 10 years	Percentage population change
Gosport	82,277	80,533	-1,744	-2.12
Copeland	67,425	66,174	-1,251	-1.86
Barrow-in-Furness	67,354	66,197	-1,157	-1.72
Ipswich	139,295	138,114	-1,182	-0.85
North East Lincolnshire	157,745	156,916	-829	-0.53
Fareham	114,562	114,536	-26	-0.02

Notes

1. Isles of Scilly has been omitted from the table because of its small population size.

Figure 1 illustrates how the population of each local authority in England is projected to change. Additional insights into the main causes of population change for a particular local authority can be found using the interactive tool.

Figure 1: Projected population change for local authorities in England between mid-2022 and mid-2032

Notes

1. Figures may not sum because of rounding.
2. The City of London is an outlier that has been omitted from the map to improve its usability.

4 . Projected change by region

The population of England is projected to increase by 6.4% between mid-2022 and mid-2032, from 57.1 million in mid-2022 to 60.8 million in mid-2032. By mid-2047, the population of England is projected to be 64.4 million. More information on national-level projections is available in our [National population projections: 2022-based bulletin](#).

The population of every region in England is also projected to increase by mid-2032. Figure 2 shows the projected change at a regional level. The South West is projected to be the fastest-growing region; its population is projected to increase by 7.5% by mid-2032, an increase of 430,000 people. The North East is the region with the slowest projected population growth in both absolute and percentage terms, with a projected increase of 130,000 people, or 4.8%.

In all regions except London and the West Midlands, negative natural change is offset by positive internal migration. In London and the West Midlands, despite negative internal migration, projected growth is mainly caused by high positive natural change and international migration.

Figure 2: Projected percentage change for regions in England, mid-2022 to mid-2032

Notes

1. Figures may not sum because of rounding.

5 . Projected change by age

England's population is projected to age, meaning that a higher proportion will be in older age groups. A common measure of ageing is the proportion of people of State Pension age, which also considers planned changes to the State Pension age. In England as a whole, this is projected to increase from 17.6% to 18.7% of the total population between mid-2022 and mid-2032. Only 11 local authorities are projected to have a declining proportion of residents of State Pension age (SPA). Most of these areas are characterised by a large population of students and/or young families.

An alternative measure of ageing is the old age dependency ratio (OADR), defined as the number of people of pensionable age per 1,000 people of working age. Working age covers all people aged from 16 years up to the SPA. Note that being over SPA does not necessarily mean someone is retired, nor are all working age people in employment.

The OADR in England is projected to increase from 275 in mid-2022 to 287 in mid-2032. Roughly 85% of local authorities in England are projected to have an increase in OADR. Richmondshire, Gosport and Lambeth are projected to see the fastest growth in OADR. North Norfolk is projected to continue to be the area with the highest OADR, rising to 624 in mid-2032.

The [interactive tool](#) allows you to explore the changing age structure of specific local authorities and includes population pyramids.

Figure 3 highlights the proportion of children and people of working and State Pension age, as well as the OADR, between mid-2022 and mid-2047 and considers planned changes to the State Pension age.

Figure 3: Projected changes in the proportion of children, people of working and State Pension age, and old-age dependency ratios, by local authority, mid-2022 to mid-2032

Notes

1. Old-age dependency ratio (OADR) is defined as the number of people of State Pension age (SPA) per 1,000 people of working age.
2. The population of State Pension age is defined as anyone who is over the State Pension age, regardless of whether they have retired or not. Projections of the State Pension age population reflect future changes under existing legislation.
3. The working age population is defined as anyone aged between 16 years and the State Pension age, regardless of whether someone is employed or not.

6 . Variant projections

As explained in our [Variant national population projections for the UK and subnational population projections and household projections for England: user guide](#), variant population projections show scenarios based on alternative assumptions of future fertility, mortality or migration.

In this release, we have included the following variant projections:

- a high international migration variant
- a low international migration variant
- a zero net migration variant
- a 10-year migration variant
- a five-year migration variant (consistent with the NPP principal projection)

The high and low international migration variants assume either higher or lower levels of net international migration to England as a whole, but the proportional distribution at local authority level remains the same.

In this release, for the first time, we have published a zero net migration variant, which shows the projected change based on zero international migration and zero migration between England and the rest of the UK.

The 10-year migration variant follows all the five-year migration variant assumptions, although it uses 10 years' worth of input data for all components except for births and deaths. A 10-year trend may even out a potentially atypical five-year period, but may reduce the effect of more systemic changes that occurred over the 10 years.

What we refer to as the five-year migration variant has been produced to align with the principal projection in the 2022-based national population projections and uses a five-year trend of data for all components of change.

The advantages and disadvantages of using different numbers of years of input data are complex. You can explore the different results for your area in the interactive Figure 4.

Figure 4: The variant population projections showing a range of future demographic scenarios by local authority, mid-2022 to mid-2047

7 . Glossary

Natural change

The difference between births and deaths.

Net migration

The difference between the number of people moving into and out of an area. Net migration consists of internal migration which is the movement of people between local authorities in England, cross-border migration which is the movement of people between England and the rest of the UK and international migration.

Internal migration

Movement of people between local authorities within England.

Cross-border migration

Movement of people between England and the rest of the UK.

International migration

The movement of people into and out of the UK.

8 . Data sources and quality

The 2022-based subnational population projections provide statistics on the potential future size and age structure of the population in England at region, county, local authority, Sub Integrated Care Boards and NHS England region levels. They are used in the production of the 2022-based household projections for local authorities, to be published later in 2025. This publication supersedes the previous (2018-based) projections.

The projections take our [Population estimates for the UK, England, Wales, Scotland, and Northern Ireland: mid-2022](#), published on 26 March 2024, as the starting point. The projected local authority populations for each year are calculated by ageing on the population from the previous year, applying local fertility and mortality rates to calculate the number of projected births and deaths, and then adjusting for migration into and out of each local authority.

The total projected population for England is also constrained to our [National population projections: 2022-based](#) for England, by single year of age and sex, for each year of the projection.

Strengths and limitations

Subnational population projections are produced across all areas in England, using a consistent methodology, so that they are relevant to all types of users. They are used in a number of ways, including:

- for local planning of health, education and other service provisions
- as a basis for household projections
- as a basis for projections produced by other organisations

Dependent on timing of central government planning rounds, they are also sometimes used in the assessment of local authority needs and the funding formula.

Since projections are produced in a consistent way, they can be used as a common framework for informing local-level policy and planning; local areas are advised to supplement them with any local information they have.

The assumptions used in the subnational population projections are based on past trends. However, demographic behaviour is inherently uncertain, so projections become increasingly uncertain the further they are carried forward. This is particularly so for smaller geographical areas and detailed age and sex breakdowns. In the longer term, demographic patterns are increasingly likely to differ from recent trends. This bulletin focuses on the first 10 years of the projections, up to mid-2032. The data files published with this release include projections going forward 25 years to mid-2047.

The projections are not forecasts and take no account of local development aims, policies on growth, capacity to accommodate population change, or economic factors that could affect the population in the future. As with the national population projections, they also do not try to predict any potential demographic consequences of future political or economic changes.

There is already a margin of error in the underlying input data used in the projections, for example, estimates of the current population and past migration flows. In addition, our assumptions about the future cannot be certain, as patterns of births, deaths, and migration are always liable to change and can be influenced by many factors. As a result of this, actual future population size can deviate from that which is projected.

More quality and methodology information

More quality and methodology information on strengths, limitations, appropriate uses, and how the data were created is available in our [Subnational population projections QMI](#).
